[illegible][illegible]

Notes

The first step in the process of identifying a problem is to determine whether there is a problem at all. This involves looking at the current situation and comparing it to what you would like to see. If there is a difference, then there is a problem. The next step is to define the problem more clearly. What exactly is the problem? How big is it? Who is affected by it? Once you have defined the problem, you can start to think about how to solve it. There are many different ways to approach a problem, so it's important to choose one that works best for you. Some people like to brainstorm ideas, while others prefer to look for solutions online or ask someone else for advice. Whatever method you choose, the key is to keep going until you find a solution that works.
